

**INSTITUTE OF ENGINEERING  
ADVANCED COLLEGE OF ENGINEERING  
& MANAGEMENT  
KUPONDOLE, LATIPUR  
(AFFILIATED TO TRIBHUVAN UNIVERSITY)**

**LAB REPORT**

**LAB NO.: 4**

**SUBJECT: C PROGRAMMING**

**SUBMITTED BY:**

**NAME: ASHWANI KUMAR CHAUDHARY**

**ROLL NO.: 019**

**DATE: 207-02-07**

**SUBMITTED TO:**

**DEPARTMENT OF  
COMPUTER &  
ELECTRONICS**

1) C program that ask a no. & test the number whether it is multiple of 5 or not, divisible by 7 but not by eleven.

```
#include <stdio.h>
```

```
void main() {
```

```
    int num, rem1, rem2, rem3;
```

```
    printf("Enter the given no.");
```

```
    scanf("%d", &num);
```

```
    rem1 = num % 5
```

```
    rem2 = num % 7
```

```
    rem3 = num % 11
```

```
    if (rem1 == 0)
```

```
    {
```

```
        printf("the no. is multiple of 5");
```

```
    }
```

```
    else {
```

```
        printf("the no. entered is not multiple of 5");
```

```
    }
```

```
    if (rem2 == 0 && rem3 == 0)
```

```
    {
```

```
        printf("the no. is divisible by both 7 & 11");
```

```
    }
```

```
    else if (rem2 == 0 && rem3 != 0)
```

```
    {
```

```
        printf("the no. is divisible by 7 but not by 11");
```

```
    }
```

```
    else if (rem2 != 0 && rem3 == 0)
```

```
    {
```

```
        printf("the no. is not divisible by 7 but divisible by 11");
```

```
    }
```

```
    else {
```

```
        printf("the no. is neither divisible by 7 nor divisible by 11");
```

```
    }
```

```
    }
```

```
}
```

2) WAP to generate & print all the prime no. bet<sup>n</sup> the range specified by users.

```
#include <stdio.h>
```

```
#include <conio.h>
```

```
void main() {
```

```
    int n1, n2, rem, count, i;
```

```
    printf ("Enter the range");
```

```
    scanf ("%d %d", &n1, &n2);
```

```
    while (n1 <= n2) {
```

```
        count = 0;
```

```
        for (i = 1, i <= n1, ++i) {
```

```
            rem = n1 % i;
```

```
            if (rem == 0) {
```

```
                count++;
```

```
            }
```

```
            if (count == 2)
```

```
                printf ("%d", n1);
```

```
                ++n1; }
```

```
    getch();
```

```
}
```

3) WAP to generate fibonacci number.

```
#include <stdio.h>
```

```
int main () {
```

```
    int n, a, b, i, temp;
```

```
    printf ("How many term would you like to print:-");
```

```
    scanf ("%d", &n);
```

```
    a = 0
```

```
    b = 1
```

```
    printf ("The fibonacci series up to %d term are:-\n", n);
```

```
    for (i = 1; i <= n; i++)
```

```
    {
```

```
        printf ("Term %d is: %d\n", i, a);
```

```
        temp = a + b;
```

```
        a = b;
```

```
        b = temp;
```

```
    }
```

```
}
```

4) WAP to calculate HCF & LCM of two integers provided by user.

```
#include <stdio.h>
```

```
int main() {
```

```
    int a, b, min, hcf;
```

```
    printf("Enter a number.");
```

```
    scanf("%d", &a);
```

```
    printf("Enter another number");
```

```
    scanf("%d", &b);
```

```
    if (a < b) {
```

```
        min = a;
```

```
    } else.
```

```
    {
```

```
        min = b; }
```

```
    for (int i = 1; i <= min; i++)
```

```
    {
```

```
        if ((a % i == 0) && (b % i == 0)) {
```

```
            hcf = i;
```

```
        }
```

```
    }
```

```
    printf("hcf = %d", hcf);
```

```
    int lcm = a * b / hcf;
```

```
    printf("lcm = %d", lcm);
```

```
    return 0;
```

```
}
```

5) KAP to read set of no. until user wants & calculate & print maximum & minimum value.

```
#include <stdio.h>
```

```
int main () {
```

```
    int no, max = 0, min = 32767;
```

```
    char choice;
```

```
    do {
```

```
        printf ("Enter a no. : ");
```

```
        scanf ("%d", &no);
```

```
        if (no > max)
```

```
        {
```

```
            max = no;
```

```
        }
```

```
        if (no < min)
```

```
        {
```

```
            min = no;
```

```
        }
```

```
        printf ("Do you want to continue (y/n) ? ");
```

```
        scanf ("%c", &choice);
```

```
    }
```

```
    while (choice == 'y' || choice == 'Y');
```

```
    printf ("\n Max. No. : %d\n Min. No. : %d", max, min);
```

```
    return 0;
```

```
}
```

6) KAP to calculate & print the term of following series up to <sup>nth term</sup>  
-10 -12 -14 -18 -26 -42 -74.

```
#include <stdio.h>
```

```
int main () {
```

```
    int tn = -10, i, n;
```

```
    printf ("Enter the no. of term you want to print :- \n");
```

```
    scanf ("%d", &n);
```

```
    for (i = 1; i <= n; i++)
```

```
    {
```

```
        printf ("%d \t", tn);
```

```
        tn = -10 - pow (2, i);
```

```
    }
```

```
    getch();
```

```
}
```

## # Conclusion & Discussion

In this Fourth lab of C programming based on the focused objective to understand about loop constructs for programming loop generations. While, do-while, for loops. This lab exercise made me more confident towards the fulfillment of the objectives,
